

Inversor solar power

Overview

It is a critical balance of system (BOS)-component in a photovoltaic system, allowing the use of ordinary AC-powered equipment. A solar inverter or photovoltaic (PV) inverter is a type of which converts the variable (DC) output of a into a (AC) that can be fed into a commercial electrical

Solar inverters use maximum power point tracking (MPPT) to get the maximum possible power from the PV array. The key role of the grid-interactive or synchronous inverters or simply the grid-tie inverter (GTI) is to synchronize the phase, voltage, and frequency of the power line with that of the grid. In conventional microinverter designs that work with one-phase power, the energy from the panel must be stored during the period where the voltage is passing through. By utilizing MPPT (maximum power point tracking), solar pumping inverters regulate output.
